(54) Title: **CRANIOTOMY DRAPE**

(57) Abstract

The present invention is a fenestrated craniotomy drape including a main sheet, translucent anesthesia side screens, a gusset forming the corners of the anterior edges of the drape, a run-off collection pouch whose back side is pressed flat and affixed to the drape, with a back side fenestration surrounding the fenestration of the main sheet, and a front side fenestration, and adjustable tube holders. The drape optionally includes a layer of a fenestrated absorbent material between the drape and the pouch, a solids screen and drain port in the pouch, and a ductile material about the edges of the front side fenestration of the pouch that holds the pouch open. The back side fenestration of the pouch and those of the drape and the absorbent material are covered by an incise sheet, located between the back side of the pouch and the drape. The adhesive side of the incise sheet facing the patient is covered by a releasable backing.

CRANIOTOMY DRAPE

Field of the Invention

The present invention is in the field of surgical drapes, more particularly in the field of craniotomy drapes.

Background of the Invention

Draping procedures create an area of asepsis called a sterile field. All sterile items that come into contact with the prepared area about the wound must be restricted within a defined area of safety to prevent transportation of microorganisms into the open wound. The sterile field is created by placement of sterile sheets and towels, or other draping materials, in a specific position to maintain the sterility of surfaces on which sterile instruments and gloved hands may be placed. The patient and operating room table are covered with sterile drapes in a manner which exposes the prepared site of incision and isolates the area of the surgical wound. Objects draped often include instrument tables, basin and Mayo stands, trays, and some surgical equipment.

Draping materials are selected to create and maintain an effective barrier that minimizes the passage of microorganisms between non-sterile and sterile areas. To be effective, a barrier material should be resistant to blood, aqueous fluid, and abrasion, as lint-free as possible, and drapable. It should maintain an isothermic environment that is appropriate to body temperature. It should meet or exceed the requirements of the current National Fire Protection Standards, so no risk from a static charge exists. Alexander's Care of the Patient in Surgery, eds. M.H. Meeker, R.N., et al., 10th edition (Mosby St. Louis, MO 1995).

Drapes covering a surface are only considered to be sterile on the side of the drape away from the surface. The portions of the drape hanging down and away from the draped object or person are not considered sterile, since the range of human vision cannot always be counted on to notice breaks in technique and resulting contamination of the drape. p. 117, G.D. LeMaitre, M.D., et al., The Patient in Surgery: A Guide for Nurses, 3rd edition (W.B. Saunders Co. Philadelphia 1975).

Neurosurgical tables currently in use are normally located over and slightly above the person on whom the operation is to be performed. The table is usually prepared for the

surgical procedure by the placement of one or more drapes, each for a specific purpose, in order to cover the non-sterile table and areas surrounding the head of the patient.

The anesthesiologist in a neurosurgical operation is usually seated to one side or the other of the operating table. It is desirable for the anesthesiologist to observe the face of the patient and the breathing apparatus connected to the patient to properly assess the patient's condition throughout the surgical procedure. Currently, in order to observe the face of the patient, the anesthesiologist either lifts up a corner of the drape, or attaches the drape to an intravenous bottle standpole, so that the face of the patient may be continuously observed. Obviously this presents problems of contamination, as the sterile field is compromised. Furthermore, neurosurgical operations are very long procedures, in which surgeons sit down for portions of time in wheeled chairs, or move about the head area of the patient. Current drapes trail onto the floor, creating accident hazards for operating room personnel as they walk about the table, as well compromising the sterility of the drape.

Electric cords and suction lines running along the patient to the head area are usually clamped or tied to the edges of the outer sheet on the table. These cords or lines can become tangled, and when pulled may cause devices to fall to the floor and become unsterile. This represents a risk to the patient while under a general anesthesia for the period of time required for the preparation of new sterile devices. Furthermore, the clamps and ties are usually not versatile or strong enough to allow easy addition or removal of tubes and electrical lines. This results in delay in surgery while operating room personnel undo and re-affix clamps.

Therefore, it is an object of the present invention to provide a drape where the face of the patient may be observed directly by the anesthesiologist without compromising the sterile field.

It is another object of the invention to provide a drape which does not trail on the floor of the operating room.

It is a further object of the invention to provide clamps on a drape which are strong and easily adjusted.

Summary of the Invention

The present invention is a fenestrated craniotomy drape including a main sheet, translucent anesthesia side screens, a gusset forming the corners of the anterior edges of the

drape, a run-off collection pouch whose back side is pressed flat and affixed to the drape, with a back side fenestration surrounding the fenestration of the main sheet, and a front side fenestration, and adjustable tube holders. The drape optionally includes a layer of a fenestrated absorbent material between the drape and the pouch, a solids screen and drain port in the pouch, and a ductile material about the edges of the front side fenestration of the pouch that holds the pouch open. The back-side fenestration of the pouch and those of the drape and the absorbent material are covered by an incise sheet, located between the back side of the pouch and the drape. The adhesive side of the incise sheet facing the patient is covered by a releasable backing.

Brief Description of the Drawings

Figure 4 is a view of the gusset and the translucent anesthesia screen.

Figure 5 is a view of the adjustable tube holders.

Figure 6 is a perspective view of an overhead table and an operating room table with a patient lying on it.

Detailed Description of the Invention

The present invention is a fenestrated craniotomy drape including a main sheet, translucent anesthesia side screens, a gusset forming the corners of the anterior edges of the drape, a run-off collection pouch whose back side is pressed flat and affixed to the drape, with a back side fenestration surrounding the fenestration of the main sheet, and a front side fenestration, and adjustable tube holders. The drape optionally includes a layer of a fenestrated absorbent material between the drape and the pouch, a solids screen and drain port in the pouch, and a ductile material about the edges of the front side fenestration of the pouch that holds the pouch open. The back-side fenestration of the pouch and those of the drape and the absorbent material are covered by an incise sheet, located between the back side of the pouch and the drape. The adhesive side of the incise sheet facing the patient is covered by a releasable backing.

General Description

The craniotomy drape of the current invention, is generally used as illustrated by 110 in **Figure 1**. It is draped over a surgical overhead table 15, under which lies a patient 5 undergoing a craniotomy procedure. The drape is designed to collect solids and fluids, such as body fluids and irrigation fluids, that collect during the course of the procedure.

Figure 2 is an exploded cut-away view of the drape 110. The drape includes a fenestrated main sheet 25, on top of which is an optional fenestrated absorbent sheet 30, and on top of that is secured the flat back side of a fenestrated run-off pouch 45, the fenestration, or hole 90 in the back of which is coincident with the fenestration 85 in the absorbent material and the fenestration 20 in the main sheet 25. An incise sheet 65 is layered between the absorbent sheet 30 and the run-off pouch 45, with a releasable backing 70.

The main sheet 25 may be made from a woven, reusable fabric, but preferably is made from a non-woven, disposable fabric such as EVOLUTION 3 ® fabric polypropylene SMS. The EVOLUTION fabric is a three-layer laminate of spunbond, meltblown, and spunbond layers (SMS). An example of a suitable fabric is found in U.S. patent no. 4,041,203, entitled, "Nonwoven thermoplastic fabric," listing inventors R.J. Brock and G.H. Meitner." This patent is incorporated herein by reference. Referring to **Figure 2**, the main sheet 25 should be large enough to cover the patient's body 5. In one embodiment of the invention, the main sheet is approximately 134 inches long by 74 inches wide. The main sheet 25 includes a fenestration 20, positioned toward the anterior portion of the drape. In one embodiment, the fenestration is oval, and placed in the midline about 24 inches from the anterior end of the drape, over the patient's head. The surgical procedure is performed within the fenestration.

On the top side of the main sheet 25 is optionally layered a fenestrated absorbent sheet 30. The fenestration 85 of the absorbent sheet is coincident with or larger than the fenestration 20 of the main sheet 25. In one embodiment, the absorbent sheet is composed of the material claimed in U.S. patent no. 5,540,979, to inventors Yahiaoui, A., Potts, D.C., Perkins, C.A., Powers, M.D., and Jascomb, J.T., entitled "Porous non-woven bovine blood-oxalate absorbent structure." This patent is incorporated herein by reference. In one embodiment, the absorbent sheet is approximately 36 inches long by 24 inches wide. In one embodiment, the absorbent sheet 30 is affixed to the main sheet 25 using cold glue.

Tube Holders

One or more adjustable tube holders 75 are secured either to the main sheet 25 or to the absorbent sheet 30 attached to the main sheet. These tube holders, as shown in **Figure 5**, are made up of two rectangular pieces of a flexible material joined at a center line like the wings of a bi-plane. In one embodiment of the invention, the material is CONTROL-PLUS™ manufactured by the Kimberly-Clark Corporation, located in Neenah, Wisconsin. CONTROL-PLUS™ is polypropylene spunbond/polypropylene meltblown/polyethylene film laminate. The upper piece has a loop and hook fastener arrangement 80 on its outer edges, while the lower piece is secured either to the main sheet 25 of the drape or to the absorbent sheet 30. In one embodiment, the tube holders 75 are affixed using a hot melt. In one embodiment of the invention, the hook and loop fastener is a VELCRO® fastener. In one embodiment of the invention, the upper and lower rectangular pieces are two inches by four inches, the velcro hook piece is one inch by one inch, and the velcro loop is one inch by two inches.

Run-off Pouch

Secured to the absorbent sheet 30, or to the main sheet 25, is a fenestrated run-off pouch 45 to collect fluids and solids generated during surgery (See **Figure 2** and **Figure 3**). The run-off pouch 45 is preferably made from a fluid-impervious material, such as translucent polypropylene, and optionally includes a drain port 55, to which a suction apparatus may be attached, and a solids screen 50, so that solids will not block the drain port 55. The back side of the run-off pouch 45 is secured to the optional absorbent sheet or directly to the main sheet 25, and includes a fenestration 90 which is roughly coincident with the fenestrations of the main sheet and the optional absorbent sheet. The back side of the run-off pouch 45 surrounds the fenestration 90 on the back side of the pouch. When in use, the closed end of the pouch hangs down and away from the head of the patient 5.

The fenestration 100 on the front side of the run-off pouch 45 has a ductile material 60 around its borders. The ductile material 60 helps keep the pouch open. In one embodiment of the invention, the ductile material is two parallel metal wires about 0.5 centimeter apart housed in flat plastic, where the plastic is secured to the border of the fenestration 100.

Incise Sheet

Turning now to **Figure 2**, layered flat between the back side of the run-off pouch 45 and the main sheet 25, or between the optional absorbent sheet 30 and the main sheet 25, is an incise sheet 65, with the adhesive side facing the patient 5. In one embodiment, the incise sheet 65 is a low-density polyethylene film with adhesive on one side. More preferably, the incise sheet 65 is constructed of polyethylene film made by Bertek Inc., St. Albans, VT 05478. The adhesive side is covered with a releasable backing 70. After the releasable backing 70 is removed, the incise sheet 65 is exposed through the main sheet fenestration 20, and will contact the patient 5 when the drape 110 is placed on the patient 5.

Gussets

As shown in **Figure 1**, and more particularly in **Figure 3**, on each side of the anterior portion of the main sheet 25 are located gussets 35. These may be of the same material as the main sheet 25. The gussets 35 may be made from a woven, reusable fabric, but preferably are made from a non-woven, disposable fabric such as EVOLUTION 3 @ fabric polypropylene SMS. In one embodiment, the gussets are approximately square, and 24 inches by 24 inches. The gussets have a main fold line 95 going diagonally across the gussets 35, which, when the drape is in use, prevent the corners of the drape 110 from trailing on the floor. (See **Figure 4**). As shown in **Figure 1**, the gusset causes the corners of the anterior of the drape 110 to become recessed, which also keeps the corner out of the way of surgical personnel in the operating room. In one embodiment, the fold lines 95 are at approximately a 45 degree angle to the front anterior edge of the drape 110.

Translucent Anesthesia Screens

As shown in **Figure 1**, and more particularly in **Figure 3**, attached to one or more edges of the anterior portion of the main sheet 25 are one or more translucent anesthesia side screens 40. In one embodiment of the invention, they are approximately rectangular, with dimensions of 30 inches by 56 inches. Preferably, the screens are clear. These side screens may be made of any appropriate translucent plastic, such as clear polyethylene film. These permit the anesthesiologist to view the face of the patient without lifting the drape and compromising the sterile field.

Use of the Drape

The craniotomy drape 110 is taken out of a pack (not shown) and draped over an overhead table 15 (see **Figure 1** and **Figure 6**), and over a patient 5 lying on the underlying operating table 10. The releasable backing 70 is peeled away, and the adhesive side of the incise sheet 65 is placed on the area of the patient's head prepared for surgery. The run-off pouch 45 hangs down and away from the head of the patient 5. A suction apparatus (not shown) may be connected to the drain port 55, and various electrical wires and tubes may be secured with the tube holders 75. Surgery is performed directly through the incise sheet 65.

Those skilled in the art will now see that certain modifications can be made to the invention herein disclosed with respect to the illustrated embodiments, without departing from the spirit of the instant invention. While the invention has been described with respect to the illustrated embodiments, it will be understood that the invention is adapted to numerous rearrangements, modifications, and alterations, and all of the foregoing are intended to be within the scope of the appended claims.

Claims

We claim:

1. A craniotomy drape comprising:
 - (a) a main sheet; and
 - (b) at least one translucent anesthesia screen attached to the lateral anterior edges of the main sheet.
2. The craniotomy drape of Claim 1 further comprising a fenestration in the main sheet.
3. The craniotomy drape of Claim 2 further comprising an absorbent sheet layered on top of the main sheet which includes a fenestration incident to the fenestration of the main sheet.
4. The craniotomy drape of Claim 3 further comprising an incise sheet between the main sheet and the absorbent layer, and a releasable layer on the adhesive side of the incise sheet.
5. The craniotomy drape of Claim 4 further comprising a fenestrated run-off pouch affixed to the absorbent sheet, with a back side fenestration surrounding the fenestration of the drape, and a front side fenestration.
6. The craniotomy drape of Claim 5 wherein the pouch includes a drain port, a solids screen, and a ductile material near the edge of the front side fenestration.
7. The craniotomy drape of Claim 6 wherein the ductile material is metal wire.
8. The craniotomy drape of Claim 3 further comprising one or more tube holders attached either directly to the main sheet or to the absorbent sheet.

9. The craniotomy drape of Claim 8 wherein the tube holders are made up of two rectangular pieces of a flexible material joined at a center line, where the upper piece has a VELCRO® loop and hook fastener arrangement on its outer edges, while the lower piece is secured either directly to the main sheet or to the absorbent sheet.

10. The craniotomy drape of Claim 1 wherein the anaesthesia screen is clear.

11. A craniotomy drape comprising:

(a) a main sheet; and

(b) at least one gusset attached to the lateral anterior edges of the main sheet.

12. A method of draping a patient for craniotomy procedures comprising use of the drape of Claim 1.

13. A method of draping a patient for craniotomy procedures comprising use of the drape of Claim 10.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 97/15148

Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. Claims: 1-10, 12
2. Claims: 11, 13

1. ☒ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☒ No protest accompanied the payment of additional search fees.
